Dear Daniel,

Thank you for your recent presentation to the medical students at the Global Elective. Your presentation entitled 'Global, Cross Cultural Anthropology of measurement, communication and Health systems' was a good overview of world systems and provided poignant insight into important new issues, such as the biophysics of human communication and the integration of body-psychotherapy, gymnastics, neurology and behavior. Several students commented that your presentation was particularly engaging.

We gladly accept your offer to be a pro bono curriculum advisor for the 4 week Global Elective Program. I continue to be fascinated with the broad range of information you have integrated and your vision to bring this synthesis to the health industry. As our elective is comprised of top medical students from 14 of the leading medical schools your balance of science, personal experience and practical application is a valuable asset to us. Your initiative to modernize several basic science concepts within physics and biology as a stepping-stone to modernize health practices is the type of innovative material that is needed to modernize the medical school curriculum.

Basing your strategy in Economic and Communication science principles with a media education focus is exciting. It gives me confidence that you are looking at the practical bottom line picture. The vision you present to conduct basic medical research that will become social and business education applications is appealing. I am interested to learn more of how I and others can work with you on these projects to improve the structure, stability and productivity of the of health industry.

I am involved with an Arts and healing organization run by medical doctors and would like you to join us. With your extensive training in the performing arts, your science and health background, and your understanding of the human body, you will be an exceptional resource as we blend art and science as a healing modality.

At a time when the health industry is displaying structural inefficiency and experiencing a substantial transformation, your progressive vision will help illuminate the path to the future. We are looking forward to considering you as a presenter for next year's Global Elective forum. Thank you and best wishes in your endeavors.
